

UI / UX Design Assignment - Task 2

Topic: UX Research, User Flow, and Low-Fidelity Wireframing Documentation

Selected Application Type: Food Delivery Application

1. Problem Statement

Working professionals and students living away from home often struggle to find affordable, healthy, and authentic home-cooked meal options during their busy routines. Existing commercial food delivery apps heavily promote fast food, add high delivery margins, and offer unpredictable delivery timelines, leading to poor dietary health and heavy monthly financial strains on users.

2. User Persona

To ground the design choices in realistic user needs, the following primary persona has been established based on the target demographic:

Name:	Ananya R
Age:	22 Years Old
Occupation:	Software Engineering Intern
Location:	Chennai, India

User Goals:

- Wants access to clean, hygienic, home-style daily lunches without cooking.
- Needs to stick to a tight monthly food allowance/budget without hidden charges.
- Requires reliable delivery scheduling that coordinates directly with fixed afternoon work breaks.

User Pain Points:

- Current market apps focus on deep-fried restaurant menus rather than basic nutritional everyday food.
- Heavy delivery premiums, service fees, and surge pricing inflate single-meal orders excessively.
- Inaccurate tracking delays deliveries past office lunchtime allocation.

3. User Journey Map

The table below tracks Ananya's step-by-step experience while trying to secure a meal during a busy working shift:

Stage	1. Discovery	2. Customization & Checkout	3. Delivery & Fulfillment
User Action	Opens the application looking for affordable meal packages.	Filters for home-style everyday meal packages, views cart breakdown, completes payment.	Tracks the rider coordinates via live mapping, collects the delivery order, and checks contents.
User Feeling	Hungry, slightly overwhelmed by general listings, looking for quick options.	Satisfied with direct meal filtering but careful about checkout parameters.	Relieved to eat on time, highly appreciative of clean eco-packaging.
Pain Point Identified	Cluttered user interface highlighting luxury restaurant banners instead of budget menus.	Too many distracting upselling prompts (add-ons, premium packs) before payment gateway.	Live mapping marker occasionally glitches or drops connection under weak networks.

4. Wireframing Architecture & Layout Plan

Following the structural logic outlined in the **User Flow Diagram** created via Draw.io, the Low-Fidelity wireframes on Figma will execute the layouts across these core mandatory structures using clear layout principles:

- 1. Splash / Welcome Screen:** Minimalist brand placeholder focusing on core navigation startup.
- 2. Authentication Screen (Login/Signup):** Standard forms utilizing distinct entry fields and a clear high-contrast call-to-action button layout.
- 3. Dashboard / Main Screen:** Top global search parameters followed by category filter pills (e.g., Veg, Budget Meals, Home-Chefs) and clear placeholder cards for local culinary providers.
- 4. Core Feature Screen (Meal Customization/Cart):** Clean listing layout containing descriptions, item tallies, clear breakdown of delivery fees, and final transaction buttons.
- 5. Profile & Tracking Screen:** Simplified dashboard detailing user active orders, operational tracking parameters, and generic contact configurations.
